

CERES Software Bulletin 97-11

October 7, 1997

Revision 1 - October 30, 2000

PCF Generator Approach

Maria Vallas Mitchum (m.v.mitchum@larc.nasa.gov)

Sandy Nolan (s.k.nolan@larc.nasa.gov)

1.0 Purpose

This bulletin describes the general rules for developing a Process Control File (PCF) Generator, which is a required step in the Langley TRMM and Terra Information System (LATIS). Since each PCF is unique, this bulletin will serve as a style guideline for the individual generators. The authors thank Joe Stassi, Alice Fan, Denise Cooper, Ed Kizer, and Ricky Brown, SAIC, for their contributions and assistance in documenting this computer bulletin.

2.0 PCF Generator Function

Each CERES Product Generation Executive (PGE), or processor, obtains processing information by reading an external file called a Process Control File (PCF). The PCF contains all of the file information and runtime parameters required by the PGE. The PCF is unique for each processor and furthermore is unique for each instance of execution of each processor.

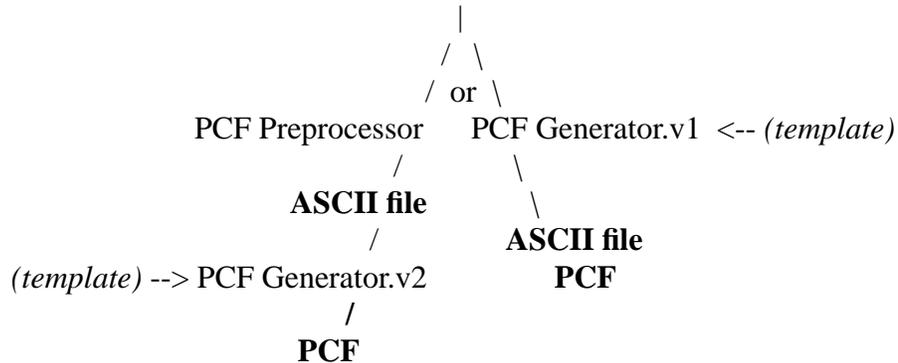

The PCF Generator is a script tailored for each PGE to create a PCF for each instance of PGE execution. It is the responsibility of each CERES Software Developer to write a PCF Generator for each processor and supply it to the LATIS Processing System.

3.0 LATIS Interface

A PCF template is supplied for each PGE. The template is a PGE-specific PCF stripped of all dynamic parameters, dynamic file names, and directory paths. The PCF dynamic values are determined at Production Request time and written to an ASCII file, referred to as 'PCFIn' file, using software provided by the CERES Software Developer, referenced as: 'ASCII File Generator' or 'PCF Preprocessor'. This software can be provided as a separate script or included at the beginning of the PCF Generator. The ASCII file contains all of the unique information needed to run the PGE for each Production Request instance and it is used to populate the PCF template. Once the PCF has been created, the process can be staged for execution. The PCF template may be embedded within the PCF Generator code.

Pictorially:

(LATIS Decision - all go?) ---> Provide Dynamic Parameters

Appendix A shows a sample ASCII file. Appendix B shows a script which both creates the ASCII file and places the items of information into the appropriate PCF template locations. Appendix C shows the created PCF file.

4.0 The PCF and PCF Input File Naming Convention

The CERES Project has a predefined naming convention for the PCF (PCF) and for the ASCII file, known as the PCF Input file (PCFin). This format is similar to the CERES output file naming convention. The following will be used:

CER[PGName]_[FileType]_SS_PS_CC.yyyymmddhh

where:

CER	= fixed
PGName	= PGName assigned to the PGE, all PGNames will start with CER appended with the PGE name.
FileType	= 'PCF' or 'PCFin'
SS	= SamplingStrategy
PS	= ProductionStrategyOutput
CC	= ConfigurationCode
yyyy	= 4-digit datayear
mm	= 2-digit datamonth
dd	= 2-digit dataday, if applicable to the PGE
hh	= 2-digit hour [00..23], if applicable to the PGE

Examples for Subsystem 1, PGE1.1P3

CER1.1P3_PCFin_Terra-FM1_Edition1_017009.20000621

CER1.1P3_PCF_Terra-FM1_Edition1_017009.20000621

5.0 The PCF Generator Input File

Information in the ASCII file, PCFin, will have the following format:

Parameter <space> = <space> Value (example: file.1 = Infile)

Each Parameter will be a predetermined variable name and will be expected on the ASCII file, if it exists. If an Input file does not exist, the ASCII file may or may not, depending on the PGE rules, insert the value: NULL or blank or completely leave out the file name. The Generator may need to contain logic to insure that if a NULL value, or blank, is found, then appropriate action will be taken to insure that the file is not placed on the PCF.

The following information must be included in the ASCII file:

- 1) CERES required metadata - from production request
- 2) PGE specific runtime parameters - from production request; these vary with each PGE.
- 3) PGE required directories
- 4) Input file names
- 5) Output file names

5.1 CERES Runtime Parameters

At Production Request time, the following information is entered, where applicable, and stored in the LATIS database from the 'DMT to DAAC Production Request'.

PGENAME

CERHrOfMonth	SamplingStrategy	ProductionStrategyOutput
CERDataDateYear	CERDataDateMonth	CERDataDateDay
Satellite (or Platform)	Instrument	Imager

The LATIS system will provide the ConfigurationCode, Software SCCR number (SWsccr), and Ancillary Data SCCR number (DATA sccr) based on the PGENAME from the Configuration Management database. The above information and PGE-specific runtime parameters are used to create the input and output file names and to fulfill the CERES metadata requirements.

The following parameters are the CERES baseline metadata (Reference 1). The format and spelling of the parameters must appear on the PCF file, as shown in field 2, using "|" as the field delimiter. The location of these parameters in the PCF is in the 'USER DEFINED RUNTIME PARAMETERS' section as shown below.

```
# =====
? USER DEFINED RUNTIME PARAMETERS
# =====
# (Note: could have other runtime info here)
# -----
# Needed for Metadata wrappers.
# -----
901|PGENAME|"CER4.1-4.1P1" /* from Production request */
902|SamplingStrategy|"TRMM-PFM-VIRS" /* from Production request */
904|ProductionStrategyOUTPUT|"SSIT" /* from Production request */
905|CERDataDateYear|"1998" /* from Production request */
```

```

906|CERDataDateMonth|"01" /* from Production request */
907|CERDataDateDay|"05" /* from Production request */
908|CERHrOfMonth|"00" /* from Production request */
909|CERHrOfDay|"01" /* from Production request */
910|ConfigurationCode|"000000" /* from LATIS database */
911|SWsccr|"00215" /* from LATIS database */
912|DATAscrcr|"00215" /* from LATIS database */
921|Instrument|"PFM" /* from Production request */
922|Platform|"TRMM" /* from Production request */
923|Imager|"VIRS" /* from Production request */
#
# =====
# END METADATA WRAPPER INFORMATION
# =====
# (Note: could have other runtime info here)
#

```

NOTE: PGName (or CERPGName) must be the first parameter listed in the metadata wrapper parameters section of the USER DEFINED RUNTIME PARAMETERS. The following lines must added at the end of metadata wrapper parameters:

```

# =====
# END METADATA WRAPPER INFORMATION
# =====

```

5.2 PGE Directory Paths

The ASCII file will contain all of the PGE required DirectoryName = DirectoryPath. The PGE Generator will then use each DirectoryName where it is applicable within the PCF template.

5.3 PGE Input Files

The Input files for a PGE are categorized as: Constant Ancillary Input Data, External Input Data, and PGE-Dependent Input Data.

1. Constant Ancillary Input Data files - are those data files which remain constant from month to month and rarely change. These files are delivered to the LATIS site by the Sub-system Development Team. There have been no restrictions made on the naming convention of these files, other than the names of the files must be a string of 80 characters or less. [It is **suggested**, but not mandatory, that the date of the file creation be entered as part of the file name, for identification.] Even though the files are described as static files, they could, in the future, be replaced by updated files. The number of files may also change. For example, in Subsystem 1, the file identifier is 'BANAL' and the number of files = 2, the ASCII file would contain:

```

BANAL.1 = Instrument_Engineering_Limits.19980203
BANAL.2 = Elevation_Scan_Offsets.19971212

```

2. External Input Data - is data received at the LATIS DAAC from other DAACs or other processing Data Centers. If any special database tables of information need to be built and populated by the Processing System at the time of ingestion, they will be designed and created

for each specific External Data Set. The filenaming convention will depend on the data provider and the LATIS system.

For example, Subsystem 2 will require the snow data from NSIDC which comes in the following format: f10_iwva_YYDDD_dayAD.hdf.gz where YYDDD is the year and day of the year. The ASCII file would contain:

```
Inputf10.1 = f10_iwva_97350_dayAD.hdf.gz
```

3. PGE-Dependent Input Data Files - are those data files that have been generated by an earlier PGE processor. The specific PGE-Dependent input Data Set Names will be identified for each PCF Preprocessor. It will be the task of the Processing System to provide the PGE the knowledge of the existence of an input file and the AutomaticQualityAssessment value of the desired input file. Given the Data Set Name, SamplingStrategyInput, ProductionStrategyInput, and the appropriate instance qualifiers (such as year, month, day, hour), the LATIS system will determine the existence and status of the input file. As stated above in section 4.0 and restated here for emphasis 'If an Input file does not exist, the ASCII file may or may not, depending on the PGE rules, insert the value: NULL or blank or completely leave out the file name. The Generator may need to contain logic to insure that if a NULL value, or blank, is found, that appropriate action will be taken to insure that the file is not placed on the PCF.'

For example, for Subsystem 4.5-6.1P1, a typical input data file would be:

```
SS4.5_Inputfile.1 = CER_SSFI_TRMM-PFM-VIRS_Edition1_000012.1998100105
```

5.4 PGE Output Files

The output filenames expected to be produced by a processor will be written to the ASCII file. The naming convention will use the Runtime Parameters as the input values to be used in the construction of each output filename.

For example for Subsystem 4.5-6.1P1, a typical output data file would be:

```
SS4.5_Outputfile.1 = CER_SSFB_TRMM-PFM-VIRS_SSIT_000000.1998050101
```

6.0 PCF and ASCII File Generator

An example of an ASCII file, PCFin, is listed in Appendix A. An example PCF and ASCII File Generator script, pcfgen_4.5-6.1P1.csh, for Subsystem 4.5-6.1P1 is located in Appendix B of this bulletin and a copy of the generated PCF file, CER4.5-6.1P1_PCF_TRMM-PFM-VIRS_SSIT_000000.1998050101, is located in Appendix C.

6.1 Customizing the PCF Generator Example

To customize the PCF Generator Example script, provided in this document, for a different PGE, perform the following steps:

- 1) Examine the PCF template for your PGE and identify all variable directory paths, file names, and runtime parameters.

- 2) List all variables identified in Step 1 using a “parameter = value” format (see Section 4.5).
 - A) Modify the PCF and ASCII file generator script to include the runtime parameters, directory paths, and file names required for your PGE
 - B) Set and use environment variables for all variable PCF data.
- 3) Modify the second section of the PCF Generator script to create the PCF, using these environment variables set in Step 2.
- 4) Set environment variable \$PGS_PC_INFO_FILE to the path and name of your PCF template. The PCF Generator script will set \$PCFile to the path and name of the generated PCF.
- 5) Run the PCF Generator script with the data date as a command-line argument. A PCF file and ASCII Input File will be generated.

#!/bin/csh -f
#####
# pcfgen_4.5-6.1P1.csh
#
# Inversion script that creates the ASCII input file,
# then creates the PCF file for PGE CER4.5-6.1P1 for use
# during production.
#
# The CERES Inversion environment variable script,
# ENVinversion-env.csh, must be sourced before running
# this script.
#
#####
# The following parameters must be set on the command line:
# $1 is the 4-digit year, the 2-digit month, the 2-digit day and
# the 2-digit data hour of the day of the data
#
# Example: pcfgen_4.5-6.1P1.csh 1997122800
#
# The following environment variables are set by sourcing
# environment file, ENVinversion-env.csh :
# $CCode4_5 - the Configuration Code for Subsystems 4.5 and 4.6
# $CCode4_1 - the Configuration Code for Subsystems 4.1 through 4.4
# $CCode12 - the Configuration Code for Subsystem 12
# $outPS4_5 - Production Strategy for Subsystems 4.5 and 4.6 output files
# $inPS4_1 - Production Strategy for input from Subsystems 4.1 through 4.4
# $inPS12 - Production Strategy for input from Subsystem 12
# $outSS4_5 - Sampling Strategy for Subsystems 4.5 and 4.6 output files
# $inSS4_1 - Sampling Strategy for input from Subsystems 4.1 through 4.4
# $inSS12 - Sampling Strategy for input from Subsystem 12
# $SWsccr4_5 - Software SCCR number for Subsystems 4.5 and 4.6
# $DATAsccr4_5 - Data SCCR number for Subsystems 4.5 and 4.6
#
# Parameter WrFlux is set to control which TOA and surface fluxes are written to
# the SSF HDF product
# Wrflux = 0; no fluxes are written to SSF HDF product
# Wrflux = 1: only fluxes where footprint is clear sky (95-100% clear)
# are written to SSF HDF product
# Wrflux = 2: only fluxes where footprint is clear sky (99.9-100% clear)
# are written to SSF HDF product
# Wrflux = 3: all fluxes are written to SSF HDF product
